"Changes in the Central Nervous System as a Result of a Cardiopathogenic Diet."

Budapest, Kisebéltes Orvostudomány, Vol IV, No 3, June 1963, pp 287-291.

Abstract: [Authors' Hungarian summary] Rats were kept on a cardiopathogenic diet and the authors observed the following symptoms by EEG studies: a gradually increasing excitability, starting from the first week of the experiment, was seen in the spontaneous activity as well as in the responses given to electric stimuli. Conditional reflex responses started soon to decrease in spite of daily reinforcements. Infarctoid heart damages occurred only after the fifth week of the study. Therefore it is suggested that the increased state of excitement of the central nervous system might also play a role in the development of changes in the heart. } Hungarian, } Western references.

"Central Nervous Lesions Caused by Cardiopathogenic Diet"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement
to Vol 22, 1963; pp 16-17.

Abstract [Authors' English summary, modified]: It has been investigated
whether the cardiopathogenic diet S-65 would damage the heart muscle
or disturbs also the central nervous regulation. It was found that
functional nervous changes occurred during the first week of the experi-
ment, whereas the myocardial lesion developed in the fifth week.
Hence increased central nervous excitability may probably have a role
in the development of myocardial lesions.

"Central Nervous Effect of Cardiopathogenic Diet"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 23,
No 2, 1963, pp. 205-210.

Abstract: [English article; authors' English summary] In rats fed on a
cardiopathogenic diet the electro-encephalogram showed since the first
week of the experiment an increasing excitatory activity, both sponta-
neous and in response to electrical stimulation. In spite of daily re-
inforcements, the conditioned-reflex responses soon began to diminish.
Infarctoid cardiac lesions did not develop until after the fifth week
of the experiment. It was therefore assumed that the increased excita-
tion of the nervous system, too, might play a role in the development
of the cardiac changes. Eight references, including 5 Hungarian, 1
German, and 2 Western.

ly was indicated by the EEG, and a rapid impairment of the established temporary connections could be noted in conditioned reflex experiments. Since vitamin E is known to have a favorable influence on TOCP intoxication, its influence on the nervous changes was studied. EEG studies were carried out on cats treated with 7 mg/100 g vitamin E before, simultaneously, as well as for longer periods after poisoning with TOCP. The treatment previous to the poisoning produced the best results, greatly diminishing the EEG and conditioned reflex disturbances. The protective effect of the vitamin was less marked and of brief duration when administered simultaneously. [JPRS]

ACC NR: AT6007401

For the pathological changes in the cerebral electrical activity, bradycardia and EEG alterations, the motor nerve endings were blocked with tubocurarine, in rats. Artificial respiration was maintained. It was found that the pathological changes in cerebral activity constitute a primary occurrence absolutely independent of the respiratory changes, heart rate and convulsions. The inhibition of convulsions by curarization and artificial respiration did not protect against the pulmonary edema induced by NH_4Cl , but prevented the respiratory paralysis. They afforded, however, no protection against the cardiac repolarization disturbance. [JPRS]

TITLE: Changes in the bioelectric activity of the brain in experimental hyperoxia

SOURCE: Ideggyógyászati szemle, no. 1, 1966, 18-23

TOPIC TAGS: bioelectric phenomenon, EEG, rat

ABSTRACT: Registered by implanted cortical electrodes, rough, non-specific changes in amplitude and frequency as well as spike bursts could be observed on the EEG of rats exposed to oxygen under a 3.7 atm. pressure. The appearance of EEG changes precedes the respiratory and cardiac functional damage and also the earliest stage of development of "hyperoxic" pulmonary edema; the O₂ saturation of the arterial blood is also normal at this stage. Binding of the CO₂ produced by the animals, thereby inhibiting its removed inhalation delays the EEG changes and in part inhibits the development of spike potentials. Impairment to the bioelectric activity of the brain is the earliest symptom of oxygen intoxication. Orig. art. has: 2 figures and 2 tables.

"Recent Experiments with Pulmonary Edema."

Budapest, Kisérletes Orvostudomány, Vol XVIII, No 2, Apr 66, pages 153-162.

Abstract: [Authors' German summary] By means of EED experiments using implanted cortical electrodes in rats, it was possible to confirm the conclusions arrived at through other means that the central nervous system plays an important role in the development of pulmonary edema caused by NH_4Cl and adrenalin; pulmonary edema caused by allunan, however, is caused exclusively by pulmonary damage. In pulmonary edema elicited with NH_4Cl , the bioelectric disturbances of the brain is independent of the convulsions, bradycases and changes in cardiac frequency and manifests itself before the appearance of the pulmonary edema. The experimental pulmonary edema, developed using NH_4Cl , will not be washed off by the administration of course or by machine respiration. 12 Eastern European, 3 Western references. SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, no. 1-2, 1965, 193-197

TOPIC TAGS: nervous system, circulatory system disease

ABSTRACT: The components of the complex diet S₆₅, which has the effect of the establishment of a state of excitement and increased irritability of the nervous system resulting in the development of infarctoid cardiopathy, are less detrimental when administered one by one. The complete diet S₆₅ was found to cause considerably more serious lesions in nervous function than the total of the effects caused by the components themselves. Consequently, the damaging effects are synergised, the components of the diet potentiate their mutual effects. Orig. art. has: 5 figures. [Orig. art. in Eng.] [JPRS]

TITLE: Research on Filters Made of Porous Concrete (Issledovaniya fil'tra iz poristogo betona)

PERIODICAL: Gidrotekhnika i melioratsiya, 1958, Nr 10, pp 36-45 (USSR)

ABSTRACT: Since 1956, VNIIGIM has been examining the properties of porous concrete used for filters of wells. The author describes the structure, strength, porosity and specific weight of porous concrete, and the manufacture of filters made of this material. He analyzes a number of formulae and mentions the names of A.I. Atapin, M.Ya. Yeliseyev and Petersen. As a result of the studies made by VNIIGIM, he arrives at the following conclusions: 1) the strength of porous concrete is reduced with an increase in the size of the filler at the same quantity of cement; 2) fillers in the rolled form of grains guarantee a greater strength than crushed fillers; 3) at the same quantity of cement, the porosity of porous concrete on crushed fillers proved to be much better than that on grain-shaped fillers; 4) the filtration coefficient of porous concrete exceeds the filtration coefficient of the soil by two and a half times; 5) fillers with rolled or non-rolled grains can be used for the manufacture of filters

Card 1/2

Research on Filters Made of Porous Concrete

SOV/99-58-10-6/15

from porous concrete; 6) the optimum ratio $\frac{D_{\text{filler}}}{D_{\text{sand}}}$ (for homogeneous sands) varies from 7 to 10,

where: D_{filler} = diameter of the particles of the filler

D_{sand} = diameter of the particles of the sand;

7) porous concrete with a heterogeneous filler shows less filtration properties than concrete with a homogeneous filler, but the strength of both is the same. The composition of porous concrete for filters is recommended by the author and explained by graphs.

There are 4 sets of graphs, 2 tables, 1 diagram, 1 photograph and 3 Soviet references.

TITLE: The Manufacture of a Water-Resistant Filter From Porous Concrete for Shaft Wells

PERIODICAL: Gidromekhanika i melioratsiya, 1959, Nr 5, pp 19-26 (USSR)

ABSTRACT: The article describes 2 types of porous concrete tubing to filter the shaft wells, the "K-1" and "K-2", developed by the Vsesoyuznyy nauchno-issledovatel'skiy institut gidrotekhniki i melioratsii imeni A.N. Kostyakova (All-Union Research Institute of Hydraulic Engineering and Melioration imeni A.N. Kostyakov). Both models are to be cast in a vibrator mould. The "K-1" model is 1 m in diameter, 1.6 m in height, and the wall is 8 cm thick. The model's joining method was devised by the Giprovodkhoz MSKh SSSR. The rings are joined by 4 coupling rods with ring-shaped ends. The latter protrude 6 cm above the upper rim and cause trapezoid-shaped apertures which are located

Card 1/2

SOV/99-59-5-3/9

The Manufacture of a Water-Resistant Filter From Porous Concrete
for Shaft Wells

on the ring's base. The ring's central part, 76 cm in height, is made of porous concrete whereas its upper and lower parts, each 12 cm high, consist of solid concrete. The "K-2" model differs from the "K-1" model insofar as it lacks the trapezoid apertures. The joining is done by 3 to 4 pairs of cover plates. Both models are cast in a vibrator mould with subsequent dipping in a special asphalt-bitumen varnish for impregnation. For speedier drying as well as increasing the shaft tubes' porosity, i.e., their filtering capacity, they must be blown through at an approximate rate of 9-10,000 cu m of air per hr. This is best done by a ventilator of the Nr 4-type manufactured by the "Sirokko" Plant. The varnish for dipping is of the GOST 6531-51 or 1347-41 types, that of the solvent- GOST 1928-50. There are 4 sets of diagrams, 1 photo, 1 graph, and 1 table.

TITLE: Plasma bent in curved magnetic field

SOURCE: Atomnaya energiya, v. 19, no. 4, 1965, 329-335

TOPIC TAGS: plasma electromagnetics, plasma dynamics, plasma density,
moving plasma, plasma magnetic field, plasma velocity

ABSTRACT: One of the useful techniques for purifying plasma bursts is to use a curved magnetic field for removal of impurities. After a brief discussion of methods employed, the authors describe their experiments with a plasma moving around a 90° bend in a curved quadrupole field formed by a system of four parallel conductors. This device was proposed to the authors by L. A. Artsimovich. Its arrangement is schematically shown on Fig. 1 (card 2/3). Two 30 cm long guide fields are interconnected by a bent field with a curvature radius $R = 30$ cm. The magnetic system is fed from the capacitor bank of 1500 microfarads. The plasma was produced by a coaxial electrodynamic gun. The greatest field intensity in the slit between conductors was 6 kilogauss. The maximum front velocity attained a rate of 10^7 cm/sec while the velocity

which are solved numerically on the computer Ural-1. The results are plotted as a I/A versus at graph for various values of the parameter a . It is shown that for $a \approx 0.11$ (vylite), the optimum regime is defined by the condition $A \approx 30$, where the first current amplitude equals 69% of the amplitude corresponding to the sustained oscillations, and the second is lower by an order of magnitude. These results are verified experimentally on a 130-mm diameter, 50-mm thick "vylite" disk. The current densities attained in the circuit were as high as 1 to 1.3 kAmp/cm² at 4 to 6 μ sec duration. It is shown that the current density pulse increases substantially if the disk is connected in parallel to the circuit. orig. art. has: 9 equations, 4 figures, and 3 tables. [04]

Abs Jour : Referat Zhur - Biologiya, No 16, 1957, 71887
Author : Nikolaevskaya, V.P.
Inst :
Title : The Treatment of "Ozena" with Streptomycin.
Orig Pub : Tr. gos. N. I. in-ta Ykha, Gorla i Mosa, 1956, vyp. 7,
152-158

Abstract : "Ozena" patients were treated with streptomycin (I).
I was injected into the muscle in the course of 10 days
in doses of 500,000 units twice daily and simultaneous-
ly the nose area was sprayed with 2-3 ml solution con-
taining 250,000 units of I. The general condition was
improved (decrease in incrustations, in dryness of the
mucous membranes of the upper respiratory tract, loss
of odor) in 55 out of 60 patients. The improvement ap-
peared on the 7th-10th day of treatment; a distinct
healing effect could be found 30 or more days after the

SOV/1779

Akademiya nauk SSSR. Institut geografii.

Ispol'svaniye topograficheskikh kart pri geograficheskikh issledovaniyakh. (Use of Topographic Maps in Geographical Exploration) Moscow, Izd-vo AN SSSR, 1958, 118 p. 2,000 copies printed.

Resp. Ed.: N.P. Leont'yev, Candidates of Technical Sciences; Ed. of Publishing House: V.S. Volynskaya; Tech. Ed.: S.G. Markovich

PURPOSE: This book is intended for geographers or cartographers who use topographic maps in connection with their activity.

COVERAGE: This book is a collection of papers given at the Inter-departmental Conference on Topographic Maps called by the Institute of Geography, Academy of Sciences, USSR in 1955. The aim of the conference was to discuss and solve problems in the use of maps and to find means of improving the contents of maps. Included in the papers are discussions of map making methods, contents of Soviet maps, the use of maps for physico-

TITLE: Determination of the Average Velocity of Seismic Waves
in the Carbonate Rocks of the Russian Platform by Com-
bined Use of the Records of Reflected and Refracted
Waves (Opredeleniye sredney skorosti v karbonatnykh
otlozheniyakh Russkoy platformy pri sovmestnom ispol'-
zovanii godografov otrazhennykh i prelomlennykh voln)

PERIODICAL: Razved. i promysl. geofizika, 1955, Nr 14, pp 7-13

ABSTRACT: A method of using different records is proposed for
determining the effective velocity of a layer lying be-
tween a reflecting and a refracting horizon. For this
purpose, the use of direct and reverse records of re-
flected and refracted waves obtained for the same seg-
ment of profile is recommended. It is assumed that the
outer reflecting and refracting surfaces are flat and

itization. New deep seismic sounding data in the region of the Kurilo Islands indicate a complex block character of deep crustal structure caused to a greater degree by change of the composition of its rocks than a change of thickness. The velocity of propagation of elastic waves at the M discontinuity in the southern regions is considerably greater than in the region of the underwater Vityas' Range -- 7.8-8.2 km/sec and 7.0-7.2 km/sec respectively. Specialists of the Sakhalin Integrated Scientific Research Institute have formulated a model of the earth's upper mantle with four asthenospheric layers at depths of 65-90, 120-160, 230-300 and 370-430 km, alternating with layers of high strength of matter. The asthenospheric layers are characterized by high absorption of transverse seismic waves, indicating a plasticity of the matter of these layers. The volcanoes of the Kuriles are projected onto the second asthenosphere, which must be regarded as a zone of magma formation. In eastern Kamchatka and in the Kuriles there is a system of faults associated with the continent-ocean boundary zone which extends to a depth of 500 km. The system of faults associated with the trench is traced only to depths of 200-250 km. Orig. art. has: 1 figure. [JPRS: 37.710]
